beams with optical waveguides. We find a single swift electron to produce a guided photon with large probability. The change in energy and propagation direction of the electron reveals the creation of a photon, with the photon energy directly read from the energy-loss spectrum or the beam displacement.

intrinsic difficulties associated with single-photon generation. The main part of this review, Section 4, is devoted to reviewing the principal designs for deterministic single-photon sources and their basic functions. This list is necessarily far from complete, with new designs or combinations of mentioned designs constantly being developed.

Recently, single and entangled photon pairs have been used in quantum key distribution experiments in fiber optics, in order to implement these quantum communications protocols [6], [7]. The FWM process in optical fibers provides a natural way to generate single and entangled photons directly inside a fiber.
